Descriptive evidence categories

Not a mandatory sequence

Classify the claim and the tested use; report missing design attributes.

Distinct evaluation designs (Tiers 0–2)

Tier 0

Internal evaluation

Held-out records within the development source

Tier 1

External or temporal test

Document source, date, overlap and assay match

Tier 2

Prospective evaluation

Freeze the model and rule; record new measurements and blinding status

Parallel placement does not imply equivalent evidential strength.

Across categories: uncertainty, calibration, domain retention and assay repeatability

Tier 3 Regulatory use for a named context

Separate regulatory status

Assessment follows the applicable pathway; it is not an automatic next step or a universal model certificate.

Different pathways: ICH M7 impurity assessment; E14/S7B integrated cardiac risk assessment.

Ranking, paired change and candidate selection need their own comparators. No endpoint-wide tier is assigned.
